Functional and logic programming
- written exam -

Important:
1. Subjects are graded as follows: of - 1p; A – 1.5p; B - 2.5p; C - 2.5p; D - 2.5p.
2. Prolog problems will be resolved using SWI Prolog. The following are required: (1) explanation of the code and of the reasoning behind it; (2) recursive model that solves the problem, for all the predicates used; (3) specification of every predicate (parameters and their meaning, flow model, type of the predicate - deterministic/non-deterministic).
3. Lisp problems will be resolved using Common Lisp. The following are required: (1) explanation of the code and of the reasoning behind it; (2) recursive model that solves the problem, for each function used; (3) specification of every function (parameters and their meaning).

A. Given the following PROLOG predicate definition **f(integer, integer)**, with the flow model (i, o):

```
f(20, -1):-!.
f(I,Y):-J is I+1, f(J,V), V>0, !, K is J, Y is K.
f(I,Y):-J is I+1, f(J,V), Y is V-1.
```

Rewrite the definition in order to avoid the recursive call **f(J,V)** in both clauses. Do NOT redefine the predicate. Justify your answer.

B. Given a nonlinear list containing numerical and non-numerical atoms, write a LISP program that verifies if the numerical atoms in the list form an increasing sequence. For example, for the list (A B 1 (2 C D) 3 4 (F T 6 10 (A E D) (34) F) 111)) the result will be **true** (T), and for the list (A B 1 (2 C D) 3 4 (F T 6 1 (A E D) (34) F) 111)) the result will be **false** (NIL).

C. Write a PROLOG program that generates the list of all subsets with at least N elements such that the value of sum of all elements from each subset is divisible with 3, from a list of integers. Write the mathematical models and flow models for the predicates used. For example, for the list L=[2,3,4] and **N**=1 ⇒ [[3],[2,4],[2,3,4]] (not necessarily in this order).

D. Given a nonlinear list, write a Lisp function to return the list with all the numerical atoms that are multiple of 3 removed. **A MAP function shall be used.**
Example   **a)** if the list is (1 (2 A (3 A)) (6)) => (1 (2 A (A)) NIL)
b) if the list is (1 (2 (C))) => (1 (2 (C)))
